The project is located in Jebel Ali Hills, in the Saih Shuaib area of Dubai (United Arab Emirates). It is a growing residential development that includes large areas dedicated to community services, green spaces, and quality public areas, aiming to create a modern and functional community.

Within this environment, a new healthy living zone has been installed, equipped with extension machines, bars, climbers, an abdominal station, and a stationary bike, designed to promote outdoor physical activity and the overall well-being of residents. To cope with the high temperatures of the desert environment, the area includes tensioned sails that provide shade, comfort, and safety, turning the space into a true climate refuge. This intervention reinforces the commitment to sustainable, functional, and environment-adapted urban planning, positioning Jebel Ali Hills as an active, healthy, and connected community.
