SABI is a modular pergola composed of a Planter and a steel structure designed for the growth of climbing plants, providing seasonal shade. It is intended for sunny pedestrian areas where planting trees is not feasible. Its structure allows for the incorporation of different climbing systems and is designed to support the weight of vigorous, mature climbing plants, including long-lived and drought-resistant species. Over time, the vegetation forms a natural canopy that provides shade and enhances the environmental comfort of the urban space.

Pergola **SABI** VRP000

Materials & Finishes:

Corten steel: The material itself creates its own protection through oxidation. The oxidation process goes through different stages of color until it reaches "stop," which is when it acquires its final color and stops losing rust and staining.
The oxidation process and its tone vary depending on the location where the product is installed and the sun/rain/wind cycles to which it is exposed.

Stainless steel: Structural alloy with a high chromium and nickel content, resistant to corrosion. High resistance to weather, humidity, UV rays and chemical agents present in urban environments. Thanks to the natural formation of a protective passive layer, stainless steel does not require additional coatings, ensuring excellent durability, low maintenance and a clean, timeless appearance – even under demanding conditions such as coastal or industrial areas.

Stainless steel cable mesh: A flexible, high-strength net made of AISI 316/304 stainless steel, integrated into the pergola's upper structure. Designed to support and guide the growth of climbing plants, it allows for the gradual formation of a uniform plant cover. It stands out for its high tensile strength, resistance to weathering and corrosion in outdoor environments, maintaining a light and discreet visual impact without compromising structural integrity.
